

# RTA-OSEK

# Fujitsu 16LX with the Softune Compiler

#### Features at a Glance

- OSEK/VDX OS version 2.2 certified OS
- RTOS overhead: 12 bytes RAM, 112 bytes ROM
- Category 2 interrupt latency: 168 CPU cycles
- Applications include: Passenger Comfort Systems, Security Access Control, Window and Mirror Control

#### **RTA-OSEK**

RTA-OSEK provides an application design environment that combines the smallest and fastest OSEK RTOS with an unique timing analysis tool.

This port data sheet discusses the Fujitsu 16LX family port of the RTA-OSEK kernel alone and should be read in conjunction with the Technical Product Overview "Developing Embedded Real-Time Applications with RTA-OSEK" available from LiveDevices.

The kernel element of RTA-OSEK is a fixed priority, pre-emptive real-time operating system that is compliant to the OSEK/VDX OS standard version 2.2 for all four conformance classes (BCC1, BCC2, ECC1 and ECC2) and intra processor communication using OSEK COM Conformance Classes A and B (CCCA and CCCB).

All CPU overheads of the kernel have low worst case bounds and little variability in execution time. The kernel is particularly suited to systems with very tight constraints on hardware costs and where run-time performance must be guaranteed.

The kernel is configured using an offline tool provided with RTA-OSEK. Determining in advance which features are used allows memory requirements to be minimized and API calls to be optimized for greatest efficiency.

All tasks and ISRs in RTA-OSEK run on a single stack – even extended tasks. This allows dramatic reductions in application stack space requirements.

The RTA-OSEK kernel is designed to be scalable. When a task uses queued activation or waits on events, the additional RTOS overhead required to support these features is paid by the task rather than by the system. This means that a basic single activation task uses the same resources in a BCC1 system as it does in an ECC2 system.

# Compiler/Assembler/Linker

The libraries containing the code for the RTA-OSEK kernel have been built using the following tools:

- Fujitsu FFMC-16 Family Softune C Compiler Version V30L06
- Fujitsu FFMC-16 Family Softune Assembler Version V30L07
- Fujitsu FFMC-16 Family Softune Linker Version V30L07

#### Memory Model

The Fujitsu 16LX C compiler supports four memory models: Small Medium, Compact and Large. The Fujitsu 16LX port of RTA-OSEK supports the Medium memory model.

# **ORTI Debugger Support**

ORTI is the OSEK Run-Time Interface. Currently there are no ORTI compatible debuggers supported by RTA-OSEK for this target.

#### **Hardware Environment**

RTA-OSEK supports all variants of the Fujitsu 16LX family all 16LX cores

### **Interrupt Model**

RTA-OSEK for the Fujitsu 16LX family supports 9 interrupt priority levels.

# Floating Point Support

The Fujitsu 16LX uses software floating-point.

# **Evaluation Board Support**

RTA-OSEK for the Fujitsu 16LX can be used with any evaluation board. An example application is provided to run on a Fujitsu FLASH-CAN-100P-M06 evaluation board. This application can be adapted for other target boards by adjusting the linker command file (to alter the RAM locations) and one source file (if alternative output pins are required).

# **Functionality**

The below table outlines the restrictions on the maximum number of operating system objects allowed by RTA-OSEK.

	BCC1	BCC2	ECC1	ECC2
Max no of tasks		16 plus aı	n idle task	<
Max tasks per priority	1	16	1	16
Max queued activations	1	255	1	255
Max events per task	n/a	n/a	16	16
Max nested resources	255			
Max alarms	not limited by RTA-OSEK			SEK
Max standard resources	s 255			
Max internal resources	not limited by RTA-OSEK			SEK
Max application modes		2!	55	

Note that OSEK specifies that queued activations in an ECC2 system are only possible for basic tasks. Where tasks share a priority level, the maximum number of queued activations per priority level is 255.

The number of alarms, tasksets, schedules and schedule arrivalpoints is only limited by available hardware resources.

# **Memory Usage**

The memory overhead of RTA-OSEK is:

Memory type	Overhead (bytes)
RAM	12
ROM/Flash	112

In addition to the RTOS overhead, each object used by an application has the following memory requirements:

Object	RAM Bytes	ROM Bytes
BCC1 task	0	24
BCC2 task	6	32
ECC1 task	26	36
ECC2 task	28	40
Category 1 ISR	0	0
Category 2 ISR	0	31
Resource	0	10
Internal Resource	0	0
Event	0	2
Alarm	6	30
Counter	2	26
Taskset (RW)	2	2
Taskset (RO)	0	2
Schedule	8	26
Arrivalpoint (RW)	6	6
Arrivalpoint (RO)	0	6

In addition to these static memory requirements each task priority and Category 2 interrupt has a stack overhead (in addition to application stack usage). The single stack model means that this overhead applies to each priority level rather than to each task. Similarly, for Category 2 interrupts this overhead applies for each unique interrupt priority. The below table shows stack usage for these objects.

Object	Stack Bytes
Task priority level	42
Category 2 interrupt	32

RTA-OSEK provides an optimization for task termination if the user can guarantee that tasks only terminate from their entry function. Tasks that terminate from elsewhere are not eligible for this optimization and duly require 44 more stack bytes per priority level than indicated in the table above.

#### **Performance**

The following table gives the key kernel timings for operating system behavior in CPU cycles.

Task Type	Basic	Extended	Ref
Category 1 ISR Latency	52	52	K
Category 2 ISR Latency	168	172	А
Normal Termination	232	620	D

Task Type	Basic	Extended	Ref
ChainTask	532	1200	J
Pre-emption	444	880	C
Triggered by alarm	824	1264	F
Schedule	384	820	Q
ReleaseResource	432	868	М
SetEvent	n/a	2056	S
Category 2 exit switch latency	304	744	Е

All performance figures are for the non-optimized interface to RTA-OSEK. Using the optimized interface will result in shorter execution times for some operations. All tasks use lightweight termination and no pre or post task hooks were specified.

The execution time for every kernel API call is available on request from LiveDevices.

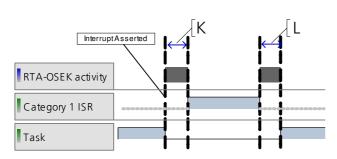

Figure 1 - Category 1 interrupt with return to interrupted task

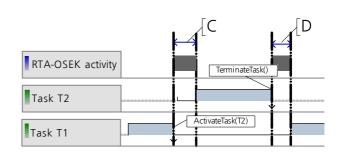

Figure 4 - Task activates a higher priority task

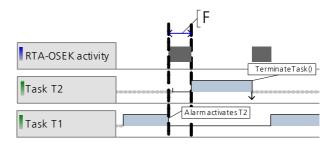

Figure 5 - Alarm activates task

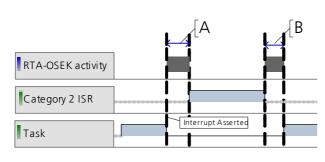

Figure 2 - Category 2 interrupt with return to interrupted task

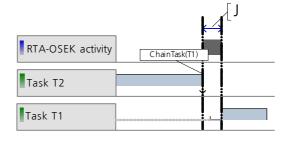

Figure 6 - Task chaining

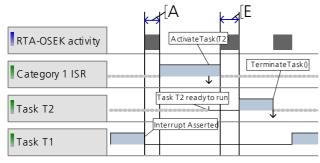

Figure 3 - Category 2 interrupt activates a higher priority task

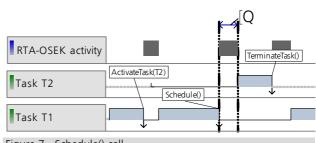

Figure 7 - Schedule() call

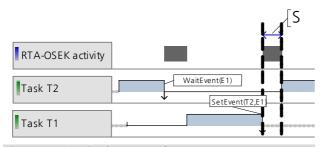

Figure 8 - Activation by SetEvent()

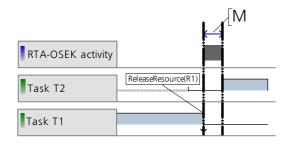

Figure 9 - ReleaseResource()

#### **Benchmarks**

The following sections shows benchmarks for RTA-OSEK memory usage for BCC1, BCC2, ECC1 and ECC2 conformant applications. The applications have the following framework:

- 8 tasks plus the idle task
- All basic tasks are lightweight tasks
- 1 Category 2 ISR with a 10ms minimum inter-arrival time
- 1 Counter
- 7 or 8 alarms, all attached to the same counter
- No resources or internal resources
- No hooks
- No schedules
- No tasksets
- Built using standard status

The following table shows the task priority configuration for each benchmark application:

Task/ISR	Stack (bytes)	Period (ms)	BCC1	BCC2	ECC1	ECC2
ISR1	10	10	IPL1	IPL1	IPL1	IPL1
А	10	10	8	8	8	8

Task/ISR	Stack (bytes)	Period (ms)	BCC1	BCC2	ECC1	ECC2
В	20	20	7	7	7	7
С	30	20	6	6	6	6
D	40	30	5	5	5	5
Е	50	50	4	4	4	4
F	60	80	3	3	3	3
G	70	100	2	2	2	2
Н	80	150	1	1	1	2
Idle	10	-	idle	idle	idle	idle

The overhead figures give the ROM and RAM required for RTA-OSEK in addition to that required by the application. The RAM figure is shown split into RAM data and RAM stack.

# BCC1

The BCC1 application uses 8 basic tasks with unique priorities.

This application has the following overheads:

	Memory usage	
OS ROM		1109
OS RAM		436
	comprising RAM data	62
	comprising RAM stack	374

#### BCC<sub>2</sub>

The BCC2 application uses 8 basic tasks with unique priorities.

Tasks A-G are attached to 7 alarms. Task H is activated multiple times from Task A and has maximum queued activation count of 255

This application has the following overheads:

Memory usage		Bytes
OS ROM		1344
OS RAM		442
	comprising RAM data	60
	comprising RAM stack	382

#### ECC1

The ECC1 application uses 7 basic tasks and 1 extended task with unique priorities. Task H is the extended task and it waits on a single event that is set by basic tasks A-G.

This application has the following overheads:

	Memory usage	Bytes
OS ROM		1772
OS RAM		521
	comprising RAM data	89
	comprising RAM stack	432

### ECC2

The ECC2 application uses 6 basic tasks and 2 extended tasks. Tasks G and H are the extended tasks and share a priority. The extended tasks wait on a single event that is set by tasks A-F.

This application has the following overheads:

Memory usage		Bytes
OS ROM		2351
OS RAM		672
	comprising RAM data	122
	comprising RAM stack	530

# **Stack Optimization**

Using stack optimization with the benchmark example identifies that the following tasks can share internal resources:

- Tasks A, B and C
- Tasks D, E and F
- Tasks G and H

The benefit of this optimization is shown in the following table:

Total Stack Space (bytes)	BCC 1	BCC 2	ECC 1	ECC 2
Non-optimized	754	762	812	910
OS Overhead	374	382	432	530
Application Overhead	380	380	380	380
Optimized	344	344	402	402
OS Overhead	164	164	222	222
Application Overhead	180	180	180	180
